

## cloud architecture

Keren Or Hadad | March 5, 2023

In my project I chose to use the following technologies:

Flask, TinyDB

I used the design pattern MVC (model, view and controller).

I chose to use Flask because it has the following advantages:

Expandable, easier development, flexibility, performance and modularity

I chose to use the mvc design pattern which has three layers, each with a dedicated role and giving and receiving service from a second layer.

In the diagram here you can see the connection between the MVC model and the cloud.

A user enters information that passes to the control layer.

A validation is done then and the control layer transfers it to the model layer which enters it into the database and saves it there.
